

Mid-project reflection:

This project has so far been quite a challenging undertaking, many of the concepts and features i am learning and implementing are very technical and new in comparison to what i've learnt previously. This has led me to really lean on effective communication and collaboration through both the class sessions and online chat options with facilitators and students to help identify and resolve issues I've faced.

I am actively improving my own work process as I've continued to focus on in previous projects, actively using the tools provided such as the 'Central Delivery' guidelines and before class videos to follow and build my comfort with these processes. My workflow has been something I wanted to focus on a lot this trimester and moving forward as I tend to poorly manage my time. 'Productivity Guys' video about workflow emphasises the strength of using step by step checklists to maximise and simplify your work (Productivity Guy, 2020). This is something I have been implementing throughout the project so far using the checklists to help me breakdown steps and work on the project each day.

I feel great about my progress so far and have greatly improved my skills and understanding on loading assets, parsing and saving various data types as well as understanding file management and accessing. The pre-class videos and activities have been a massive help in strengthening my knowledge from the class work and I feel confident in much of the content covered. I did however struggle with the loading of audio clips and while I got it working I don't quite fully grasp the conversion of the data itself into a 16 bit type. I am now working on my optimisation testing and documentation ready for submission in week 5.
